As soon as he starts to take down, I'm ready to go down, I'm ready to go to his neck. I fight to, I got to take down, but I don't fall on my back, I don't give up the position, I'm still fighting to stay up. When I say stay up, I have time to keep climbing and digging and I just, and then when I feel like I have to stay strong, when I feel I have the right position, I can lock the choke, right? So, the idea is like, I'm going down, but I'm going down but I'm just not giving up everything. I didn't kind of like collapse on top, you know? Even when he's still working to finish the takedown, I'm still staying up, I'm still fighting to stay up. That will give me like a lot of chance to recover the takedown, instead of just kind of like a fall on my back. So, the idea is, if he pulls me down, his head goes up. That's the idea. Once he starts to kind of pull my leg down, I feel like his head starts to kind of swing a little bit more slower, right? So as soon as I come down, that's going to be the time. But I have to do everything I can to don't fall down, because if I fall down, all his weight is on top of me. All his weight, and all the momentum me falling down, he can use to pass and start walking to get on my side. And maybe I have the head, but now I cannot finish because he's so close to my side. So we have to get used to, even when we're going down, we still keep strong. Even when you kind of miss, something went wrong, we still fight to kind of like, how can I keep everything together so it doesn't break and fall apart? So, as soon as he pulls me, I'm working hard so I just don't fall back. And I will do everything I can to connect the neck before I fall back, and as soon as I fall back, elbow comes up, and leg goes over from there. Let's go try this.
